Staff Software Engineer at Google DeepMind building frontier LLM post-training and scientific-agent evaluation systems, with a Berkeley physics Ph.D. and a record of shipping production ML in Search, Shopping, and Maps.

EMPLOYMENT

Google / Google DeepMind

Staff Software Engineer

Senior Software Engineer

Software Engineer

Mountain View, CA

May 2025 – Present

April 2022 – April 2025

April 2020 – April 2022

- Conceived and led development of a widely used internal benchmark for evaluating AI agents on long-horizon optimization tasks using real-world scientific simulators. Organized a collaboration across teams to gather dozens of tasks across tens of engineering and science domains, built the evaluation infrastructure and leaderboard from scratch, and evaluated 7+ frontier models.
- Co-authored research on simulator-driven reinforcement learning for agentic tool use, and designed a procedural data generation framework producing dense-reward inverse problems across 5 scientific domains.
- Built reward and value-modeling systems for reinforcement learning post-training of frontier LLMs, including rubric-conditioned critiques, deterministic code-based auto-raters, and tip-learning systems. Improved critic recall by more than $2\times$ over the prior approach without impact on precision.
- Diagnosed and resolved critical failures in frontier training runs, including silent infrastructure failures, reward signal degradation, evaluation flakiness, and distribution shifts in model behavior.
- Designed and scaled a failure-mode-driven synthetic data generation pipeline for frontier model post-training across SQL, data science, mathematical reasoning, and scientific coding. The system generated targeted training curricula with automated multi-stage quality filtering and simulator-backed verification.
- Drove adoption of synthetic training data into multiple Gemini training revisions, contributing to multi-point improvements on mathematical and tool-use benchmarks.
- Led work on attribute extraction models for Google Shopping and Maps, processing tens of millions of edits across 80+ attributes at over 96% precision. Improved multilingual coverage by $3\text{--}5\times$ recall across four languages.
- Contributed to LLM-powered systems in AI Overviews and Shopping through tool-use evaluation, reward modeling, and structured extraction supporting user-facing launches.
- Enabled partner teams across Search, Maps, and post-training by sharing models, evaluation frameworks, and infrastructure. Mentored engineers and researchers across organizations and taught an internal machine learning course.

Perimeter Institute for Theoretical Physics

Postdoctoral Researcher

Waterloo, ON, Canada

September 2017 – February 2020

- Conducted research in quantum field theory, quantum information, and quantum gravity as an It from Qubit postdoctoral fellow. Published work on black hole information, holography, entropy bounds, and quantum energy conditions.
- Co-formulated the Quantum Null Energy Condition in work on the Quantum Focusing Conjecture and co-authored its first proof, connecting quantum information inequalities to spacetime energy conditions.

EDUCATION

University of California, Berkeley

Ph.D. in Physics. Thesis: “Entropy Bounds and Entanglement.”

August 2012 – May 2017

Massachusetts Institute of Technology

S.B. in Physics. Thesis: “Shuttling of ions for characterization of a microfabricated ion trap.”

September 2008 – June 2012

AWARDS

- Product Achievement Award and Publication Excellence Award, Google Research / Google DeepMind.
- It from Qubit Postdoctoral Fellowship, Simons Collaboration on Quantum Fields, Gravity and Information.
- Editors’ Suggestion, Physical Review D, for work on quantum entropy bounds.

SKILLS

- **Core engineering:** Python, JAX, PyTorch, TensorFlow, Apache Beam, SQL, C++, distributed training, production ML debugging.
- **ML systems:** RL post-training, RLHF, reward modeling, value modeling, model evaluation, agent evaluation, tool use, synthetic data generation, long-context agents.
- **Scientific research:** scientific AI, structured extraction, simulator-backed evaluation, quantum information, quantum gravity, entropy bounds, mathematical reasoning.
